Finite Element Methods: HW 3

Answer 1 From definitions we know that $-\Delta u = -\nabla^2 u = -(\frac{\partial^2}{\partial x_1^2} + \frac{\partial^2}{\partial x_2^2}) = -\frac{\partial^2}{\partial x_1^2} - \frac{\partial^2}{\partial x_2^2}$, and so we get:

$$
\begin{aligned}
u &= x_1x_2 - x_1x_2^2 - x_1^2x_2 + x_1^2x_2^2 \\
\frac{\partial u}{\partial x_1} &= x_2 - x_2^2 - 2x_1x_2 + 2x_1x_2^2 \\
\frac{\partial^2 u}{\partial x_1^2} &= -2x_2 + 2x_2^2
\end{aligned}
$$

And by symmetry $\frac{\partial^2}{\partial x_2^2} = -2x_1 + 2x_1^2$

Thus $-\Delta u = f = -(-2x_2 + 2x_2^2) - (-2x_1 + 2x_1^2)$

Again starting from definitions, we see that ∇u is:

$$x_2 - x_2^2 - 2x_1x_2 + 2x_1x_2^2 + x_1 - x_1^2 - 2x_1x_2 + 2x_2x_1^2$$

Similarly following from definitions we have that $D^2 f$ is:

In [ ]:
```
from sympy import *
import math

init_printing(use_unicode=False, wrap_line=False)
x = Symbol('x')
y = Symbol('y')

u = x*y - x*y**2-x**2*y+x**2*y**2

D_squared_f = sqrt(abs(diff(u,x,2))**2+2*abs(diff(u,x,y))**2+abs(diff(u,y,y))**2
D_squared_f
```

Out[ ]:
$$\sqrt{4|x\,(x-1)|^2 + 4|y\,(y-1)|^2 + 2|4xy - 2x - 2y + 1|^2}$$

For this we use SymPy, but we simplify a bit further:

$$
\begin{aligned}
||u||_{L^2(\Omega)} &= \left(\int_\Omega u^2 d\Omega \right)^{\frac{1}{2}} \\
&= \left(\int_0^1 \int_2^1 u^2 dx_1 dx_2 \right)^{\frac{1}{2}} \\
&= \left(\int_0^1 \int_2^1 (x_1 - x_1^2)^2 (x_2 - x_2^2)^2 dx_1 dx_2 \right)^{\frac{1}{2}}
\end{aligned}
$$

In [ ]:
```
sqrt(integrate(u**2,(x,0,1),(y,0,1)))
```

For this we use SymPy, but we simplify a bit further:

$$
\begin{aligned}
||u||_{L^2(\Omega)} &= \left(\int_\Omega u^2 d\Omega \right)^{\frac{1}{2}} \\
&= \left(\int_0^1 \int_2^1 u^2 dx_1 dx_2 \right)^{\frac{1}{2}} \\
&= \left(\int_0^1 \int_2^1 (x_1 - x_1^2)^2 (x_2 - x_2^2)^2 dx_1 dx_2 \right)^{\frac{1}{2}}
\end{aligned}
$$

In [ ]:
```
sqrt(integrate(u**2,(x,0,1),(y,0,1)))
```

Out[ ]: $\frac{1}{30}$

Finally for $||\nabla u||_{L^2(\Omega)}$ we have:

In [ ]:
```
nabla_u = diff(u,x) + diff(u,y)
nabla_u
sqrt(integrate(nabla_u,(x,0,1),(y,0,1)))
```

Out[ ]: 0

Answer 2

We will use techniques from Lecture-4. We realize that in our case $|\overline{K}| = \frac{1}{2}$, and using the identity $\int_K \phi_1^m \phi_2^n \phi_3^p = \frac{2m!n!p!}{(m+n+p+2)!}|\overline{K}|$ Since our domain is only a triangle we expect a 3×3 matrix, which then gives us: $\begin{pmatrix} \phi_1\phi_1 & \phi_1\phi_2 & \phi_1\phi_3 \\ \phi_2\phi_1 & \phi_2\phi_2 & \phi_2\phi_3 \\ \phi_3\phi_1 & \phi_3\phi_2 & \phi_3\phi_3 \end{pmatrix}$

$$
M^{\overline{K}} = \frac{1}{12} \begin{pmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \\ 1 & 1 & 2 \end{pmatrix} \frac{1}{2}
$$

First we notice that our triangle has nodes $N_1 = (0,0), N_2 = (1,0), N_3 = (0,1)$, however $a = 1$. We have already observed that $|\overline{K}| = \frac{1}{2}$. Thus by plugging in we see that $b_1 = -1, c_1 = -1, b_2 = 1, c_2 = 0, b_3 = 0, c_3 = 1$. This means that the stiffnmess matrix is:

$$A^{\overline{K}} = \begin{pmatrix} 1 & -1 & -1 \\ -1 & 1 & 0 \\ -1 & 0 & 1 \end{pmatrix} \times \frac{1}{2}$$

Answer 3

We use the pderect tool in matlab to give us (with code given at the end of the document), a square with a square cutout. We use Mesh > Initialize Mesh to create a mesh and use Mest > Export mesh to give us the (p, e, t) matrix, all of which are included at the end of the document.

Answer 4

Observe that in our particular case we have that $a = n = 1$ and $f = 0$, and so our first equation is the one below:

$$-\nabla \cdot (\nabla u) = 0 \qquad \in \text{int}(\Omega)$$

For the boundary equation we need to do some simplification

In [ ]:
```
from sympy import *

x, y = symbols('x y')
init_printing(use_unicode=True)

u = exp(x) * atan(y)
del_u = diff(u,x) + diff(u,y)
del_u
```

Out[ ]:
$$e^x \operatorname{atan}(y) + \frac{e^x}{y^2 + 1}$$

this means that on the boundary we have (for simplification let $x_1 = x, x_2 = y$):

$$-n \cdot (a \nabla u) = \kappa(u - g_D) - g_N \qquad \in \partial\Omega$$

$$-ne^x \arctan(y) - \frac{ne^x}{y^2+1} = \kappa e^x \arctan(y) - \kappa g_D - g_N$$

```
u = exp(x) * atan(y)
del_u = diff(u,x) + diff(u,y)
del_u
```

Out[ ]:

$$e^x \operatorname{atan}(y) + \frac{e^x}{y^2+1}$$

this means that on the boundary we have (for simplification let $x_1 = x, x_2 = y$):

$$-n \cdot (a\nabla u) = \kappa(u - g_D) - g_N \qquad \in \partial\Omega$$

$$-ne^x \arctan(y) - \frac{ne^x}{y^2+1} = \kappa e^x \arctan(y) - \kappa g_D - g_N$$

Comparing coefficients then yields that: $\kappa = 1$, $n = -1$, $g_N = 0$ and $g_D = \frac{-e^x}{y^2+1}$. Please see the end of the document for the matlab implementation. We then modify the code from Larson to indicate that κ is a constant 1 and a is a constant 1. Our p, e, t, ξ matrices are at the end of the document.

Answer 5

We will adapt Step-3 for our purpose. We replace `GridGenerator::hyper\_cube(triangulation, -1,1)` on line 98 (stripped comments) with `GridGenerator::hyper\_rectangle(triangulation,{-2,-6.28},{2,6.28})`;

We then replace Line 180 with `Functions::SymbolicFunction<2> fun("exp(x)*atan(y)")` however this will require the following headers: #include <deal.II/base/function_lib.h>}$ #include <deal.II/base/symbolic_function.h> #include <deal.II/base/function_spherical.h>

Unfortunately I could not get symbolic functions to work, but I did get cosine boundaries to work and exponential boundaries to work.

```
pderect([2,3,-2,3])
pderect([-2 -1 -2 3])
pderect([-1 2 2 3])
pderect([-1 2 -2 -1])
