3/29/22, 1:55 PM HW3_1

Finite Element Methods: HW 3

Answer 1 From definitions we know that $-\Delta u=-\nabla^2 u=-(\frac{\partial^2}{\partial x_1^2}+\frac{\partial^2}{\partial x_2^2})=-\frac{\partial^2}{\partial x_1^2}-\frac{\partial^2}{\partial x_2^2}$, and so we get:

$$egin{split} u &= x_1x_2 - x_1x_2^2 - x_1^2x_2 + x_1^2x_2^2 \ rac{\partial u}{\partial x_1} &= x_2 - x_2^2 - 2x_1x_2 + 2x_1x_2^2 \ rac{\partial^2 u}{\partial x_1^2} &= -2x_2 + 2x_2^2 \end{split}$$

And by symmetry $rac{\partial^2}{\partial x_2^2} = -2x_1 + 2x_1^2$

Thus
$$-\Delta u = f = -(-2x_2 + 2x_2^2) - (-2x_1 + 2x_1^2)$$

Again starting from definitions, we see that ∇u is:

$$x_2 - x_2^2 - 2x_1x_2 + 2x_1x_2^2 + x_1 - x_1^2 - 2x_1x_2 + 2x_2x_1^2$$

Similarly following from definitions we have that D^2f is:

```
In []:
    from sympy import *
    import math

    init_printing(use_unicode=False, wrap_line=False)
    x = Symbol('x')
    y = Symbol('y')

    u = x*y - x*y**2-x**2*y+x**2*y**2

    D_squared_f = sqrt(abs(diff(u,x,2))**2+2*abs(diff(u,x,y))**2+abs(diff(u,y,y))**2
    D_squared_f
```

Out []:
$$\sqrt{4{\left|x\left(x-1
ight)
ight|^2}+4{\left|y\left(y-1
ight)
ight|^2}+2{\left|4xy-2x-2y+1
ight|^2}}$$

For this we use SymPy, but we simplify a bit further:

$$egin{align} ||u||_{L^2(\Omega)} &= \left(\int_\Omega u^2 d\Omega
ight)^{rac{1}{2}} \ &= \left(\int_0^1 \int_2^1 u^2 dx_1 dx_2
ight)^{rac{1}{2}} \ &= \left(\int_0^1 \int_2^1 (x_1 - x_1^2)^2 (x_2 - x_2^2)^2 dx_1 dx_2
ight)^{rac{1}{2}} \end{split}$$

```
In [ ]: sqrt(integrate(u**2,(x,0,1),(y,0,1)))
```

HW3 3/29/22, 1:10 PM

For this we use SymPy, but we simplify a bit further:

$$egin{align} \left|\left|u
ight|
ight|_{L^{2}(\Omega)} &= \left(\int_{\Omega} u^{2} d\Omega
ight)^{rac{1}{2}} \ &= \left(\int_{0}^{1} \int_{2}^{1} u^{2} dx_{1} dx_{2}
ight)^{rac{1}{2}} \ &= \left(\int_{0}^{1} \int_{2}^{1} (x_{1} - x_{1}^{2})^{2} (x_{2} - x_{2}^{2})^{2} dx_{1} dx_{2}
ight)^{rac{1}{2}} \end{split}$$

```
In [ ]: sqrt(integrate(u**2,(x,0,1),(y,0,1)))
```

Out[]: $\frac{1}{30}$

Finally for $||\nabla u||_{L^2(\Omega)}$ we have:

```
nabla_u = diff(u,x) + diff(u,y)
nabla_u
sqrt(integrate(nabla_u,(x,0,1),(y,0,1)))
```

Out[]: 0

Answer 2

We will use techniques from Lecture-4. We realize that in our case $|\overline{K}|=\frac{1}{2}$, and using the identity $\int_K \phi_1^m \phi_2^n \phi_3^p = \frac{2m!n!p!}{(m+n+p+2)!} |\overline{K}|$ Since our domain is only a triangle we expect a

$$3 imes 3$$
 matrix, which then gives us: $egin{pmatrix} \phi_1\phi_1 & \phi_1\phi_2 & \phi_1\phi_3 \ \phi_2\phi_1 & \phi_2\phi_2 & \phi_2\phi_3 \ \phi_3\phi_1 & \phi_3\phi_2 & \phi_3\phi_3 \end{pmatrix}$

$$M^{\overline{K}} = rac{1}{12} egin{pmatrix} 2 & 1 & 1 \ 1 & 2 & 1 \ 1 & 1 & 2 \end{pmatrix} rac{1}{2}$$

HW3 3/29/22, 1:10 PM

First we notice that our triangle has nodes $N_1=(0,0), N_2=(1,0), N_3=(0,1)$, however a=1. We have already observed that $|\overline{K}|=\frac{1}{2}$. Thus by plugging in we see that $b_1=-1, c_1=-1, b_2=1, c_2=0, b_3=0, c_3=1$. This means that the stiffnmess matrix is:

$$A^{\overline{K}} = \left(egin{array}{ccc} 1 & -1 & -1 \ -1 & 1 & 0 \ -1 & 0 & 1 \end{array}
ight) imes rac{1}{2}$$

Answer 3

We use the precedit tool in matlab to give us (with code given at the end of the document), a square with a square cutout. We use Mesh > Initialize Mesh to create a mesh and use Mest > Export mesh to give us the (p,e,t) matrix, all of which are included at the end of the document.

Answer 4

Observe that in our particular case we have that a=n=1 and f=0, and so our first equation is the one below:

$$-
abla \cdot (
abla u) = 0 \qquad \in \operatorname{int}(\Omega)$$

For the boundary equation we need to do some simplification

```
In []:
    from sympy import *

    x, y = symbols('x y')
    init_printing(use_unicode=True)

    u = exp(x) * atan(y)
    del_u = diff(u,x) + diff(u,y)
    del_u
```

Out[]:
$$e^x \operatorname{atan}(y) + \frac{e^x}{y^2 + 1}$$

this means that on the boundary we have (for simplification let $x_1=x, x_2=y$):

$$-n\cdot(a
abla u)=\kappa(u-g_D)-g_N \ \in\partial\Omega
onumber \ = \kappa e^x rctan(y)-\kappa g_D-g_N$$

3/29/22, 1:55 PM HW3_1

Out[]:
$$e^x \operatorname{atan}(y) + \frac{e^x}{y^2 + 1}$$

this means that on the boundary we have (for simplification let $x_1=x, x_2=y$):

Comparing coefficients then yields that: $\kappa=1$, n=-1, $g_N=0$ and $g_D=\frac{-e^x}{y^2+1}$. Please see the end of the document for the matlab implementation. We then modify the code from Larson to indicate that κ is a constant 1 and a is a constant 1. Our p,e,t,ξ matrices are at the end of the document.

Answer 5

We will adapt Step-3 for our purpose. We replace

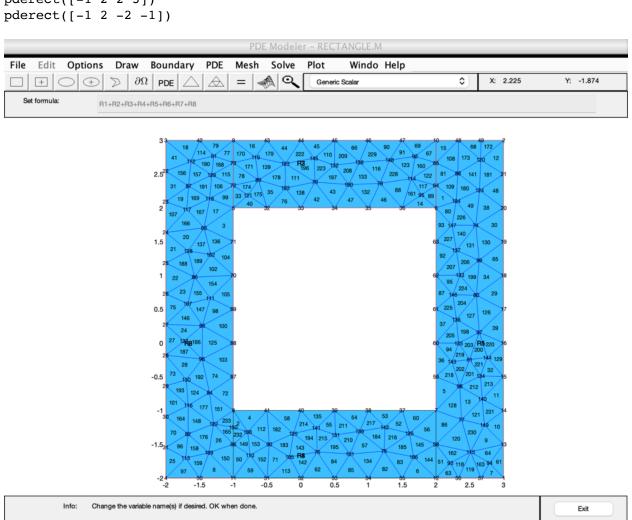

GridGenerator::hyper_cube(triangulation, -1,1) on line 98 (stripped comments)
with GridGenerator::hyper_rectangle(triangulation, {-2,-6.28}, {2,6.28});

We then replace Line 180 with

Functions::SymbolicFunction<2> fun("exp(x)*atan(y)") however this will require the following headers: #include <deal.II/base/function_lib.h>}\$ #include <deal.II/base/symbolic_function.h> #include <deal.II/base/function_spherical.h>

Unfortunately I could not get symbolic functions to work, but I did get cosine boundaries to work and exponential boundaries to work.

```
pderect([2,3,-2,3])
pderect([-2 -1 -2 3])
pderect([-1 2 2 3])
pderect([-1 2 -2 -1])
```

```
A = StiffnessAssembler2D(p,t,1);
